Short Bio

JAW is a group made up of Karina Alvarez, Devan Wong and Douglas Jenkins who are Web Development majors at Bellevue University. The goal of our group is to come together and create a single page web application using Knockout.js that will generate 10 questions for JavaScript trivia. When a user visits our web application they will be able to take the 10 question page, all of which will be in multiple choice or true/false. After you have finished the quiz, the user will get results and will provide them a score and a ranking. Rankings have three different categories: expert (8-10 answers correct), novice (6-8 answer correct) and beginner (less than 6 correct). The quiz will have move forward and go back features that will allow the user to go back to check their answers or skip ahead to the next questions. It will be required for all quiz questions to be answered prior to submission.

Bio Image:

Description of the applications proposed functionality

Some of the functions on the JavaScript trivia are multiple choice selections to choose from. When you go over each of the four choices you will notice a hover state above the answer.
